TWINOPS ENTERPRISE

Master Guide

Understand, set up, and run TwinOps Enterprise, start to finish

Version 1.0 - October 2026

Live app: https://twinops-enterprise.onrender.com

Confidential - Internal Use

A complete guide anyone can follow - no coding background needed

1. What TwinOps Is

TwinOps creates an AI version of a person, called a **Twin**. Your Twin reads your real work, your GitHub code, your Jira tickets, your Slack messages, and answers questions on your behalf. Every answer shows a citation (where it came from), so it never makes things up.

People can talk to your Twin in three places: the **web app**, **Microsoft Teams**, and **Slack**. When you are in a meeting or offline, your Twin still answers teammates, grounded in real facts.

2. How It Works (big picture)

1. **Sync** pulls your real GitHub/Jira/Slack data into the app.
2. The app **chops it into small pieces** and stores them in a database (Supabase).
3. When a question comes in, it **finds the most relevant pieces**.
4. It sends those pieces to an **AI model** (GPT-4o via OpenRouter).
5. The AI writes an answer **grounded in your data, with a citation**.

3. What You Need Before Starting

Free accounts: GitHub, Supabase (database), OpenRouter (AI, needs a few dollars of credit). Optional: Jira, Slack, Microsoft Teams.

Software (Part A): Git, Node.js, and VS Code. A normal laptop is fine.

4. Part A - Install the Tools

Git (downloads the code): git-scm.com, download for Windows, install with defaults. Verify in PowerShell:

```
git --version
```

Node.js (runs the app): nodejs.org, click the LTS button, install. Verify:

```
node --version
```

VS Code (edit files): code.visualstudio.com, install with defaults.

[SCREENSHOT: terminal showing git and node version output]

5. Part B - Download the Project

```
cd "C:\Users\YourName\Documents"
git clone https://github.com/mohammadali-2000/twinops-enterprise.git
cd twinops-enterprise
npm install
code .
```

npm install takes a few minutes, it downloads everything the project needs.

[SCREENSHOT: VS Code opened showing the project files]

6. Part C - Create Your Settings File

In VS Code, copy **.env.example** and rename the copy to exactly **.env.local**. This private file holds all your secret keys. Never share it or put it on GitHub.

7. Part D - Get Every Key

Fill these into .env.local, no spaces around the =. The first two are required.

D1. Supabase (required): supabase.com, New Project. Then Project Settings, API. Copy Project URL, anon key, and service_role key into the matching lines. Also set USE_SUPABASE_MEMORY=true.

[SCREENSHOT: Supabase API settings page with the three keys]

D2. OpenRouter (required): openrouter.ai, create a key (starts sk-or-). Set OPENAI_API_KEY, OPENAI_BASE_URL=https://openrouter.ai/api/v1, OPENAI_MODEL=openai/gpt-4o. Add a few dollars of credit.

D3. GitHub (optional): Settings, Developer settings, fine-grained token with read-only Contents + Metadata. Set GITHUB_TOKEN.

D4. Jira (optional): id.atlassian.com, Security, API tokens. Set JIRA_BASE_URL, JIRA_EMAIL, JIRA_API_TOKEN.

D5. Slack (optional): api.slack.com/apps, add bot scopes, install, copy the xoxb- bot token into SLACK_BOT_TOKEN.

8. Part E - Set Up the Database

In Supabase, open SQL Editor, New query. Copy everything from supabase/migrations/20260925000000_init_schema.sql, paste, click Run. You should see Success. This creates all tables and turns on security.

[SCREENSHOT: Supabase SQL editor after running the migration]

9. Part F - Run the App

```
npm run dev
```

Wait for 'Local: http://localhost:3000', then open that address in your browser. You should see the login page. Keep the terminal open while using the app.

[SCREENSHOT: TwinOps login page in the browser]

10. Part G - Create Your First Twin

Click 'Create your first twin', give it a name, add your GitHub/Jira details if you have them, Create. Open the sidebar, click 'Sync my GitHub & Jira', wait for it to finish. Then ask a real question in chat, for example 'What is the status of KAN-2?'. You get an answer with a citation.

[SCREENSHOT: chat showing an answer with a citation]

11. Connecting Teams and Slack

Slack: deploy first (Section 12). In the Slack app, Event Subscriptions, set the Request URL to https://YOUR-APP-URL/api/slack/events, wait for Verified. Turn OFF Socket Mode. Subscribe to app_mention, message.channels, message.im. Reinstall, then copy the fresh bot token into settings. Note: reinstalling changes the bot token, update SLACK_BOT_TOKEN if replies stop.

Microsoft Teams: deploy first. Build a Power Automate flow that triggers on the 'twin:' keyword, HTTP POSTs to https://YOUR-APP-URL/api/teams/events with the secret header, and replies with the answer.

12. The Live Website (Deployment)

The app is already deployed on **Render**: https://twinops-enterprise.onrender.com. Every push to GitHub's main branch auto-rebuilds and redeploys. Free-tier note: the app sleeps after ~15 minutes idle, so the first request takes 30-50 seconds to wake up.

13. Troubleshooting

Problem	Fix
git / npm 'not recognized'	Close all terminals, open a new one; restart PC if needed
npm install red errors	Internet dropped, run npm install again
'port 3000 in use'	Close other terminals running the app, try again

Page loads with errors	Re-check .env.local values, no spaces around =
Cannot connect to Supabase	Re-check the 3 Supabase keys; confirm the migration ran
Twin says 'no information' for all	Click Sync, wait for it to finish
AI credits error	openrouter.ai, Credits, add a little
Slack @TwinOps no reply	Turn Socket Mode off; update bot token after reinstall

14. FAQ

Does it depend on my laptop being on? No. The database and live app run in the cloud; your laptop is only for local development.

Is anything fake? No. Everything is synced from your real GitHub/Jira/Slack, with security on and secrets kept off GitHub.

Do I need Docker? No. Render runs it without Docker. The Dockerfile is only for a future AWS/Oracle container deployment, built on the cloud server, not your laptop.

Cost? Supabase, Render, GitHub, Slack, Teams are free tier. Only OpenRouter AI usage costs a little.

Can two Twins talk? Yes, a Twin can consult another Twin (max 2 hops, so they can't loop).

15. Glossary

Term	Plain meaning
Twin	An AI version of a person that answers from their real work
Terminal / PowerShell	A window where you type commands instead of clicking
Repository (repo)	A project's code, stored on GitHub
Environment file (.env.local)	A private file holding all your secret keys
API key / token	A secret password proving it's really you to another service
Supabase	The cloud database storing the Twin's memory
Embedding	Numbers representing the meaning of text, so it's searchable by meaning
RAG	Find relevant data first, then let the AI answer from it
OpenRouter	A service giving access to AI models (like GPT-4o) with one key
Citation	The source link the Twin shows for each answer
Deployment	Putting the app on a cloud server so it's on the internet
Render	The cloud host running the live app
Socket Mode	A Slack setting that must be OFF for web event delivery

End of guide. Live app: https://twinops-enterprise.onrender.com
